

ENDPOINT & KEYLOGGING PROTECTION

Making your business objectives reality
Knowledge. Experience. Methodologies. Technology.

The TBAS platform will deliver these material benefits to your organization:

Protection from

- Malware and Spyware
- Advanced threats and file-less attacks
- Phishing and other exploitation techniques
- Keyloggers, even those which are "zero-day" and polymorphic by creating an alternate pathway, routing your data around the area of vulnerability
- Anti-Screen Scraping blocks screen capture and identifies click-jacking

Regulatory Compliance

- Keystroke encryption can help raise the level of PCI/HIPA and strengthen GDPR by protecting network credentials and customer data
- Protects the credit card processor and other networks that the merchant must log into in order to perform daily functions such as download reports and viewing their account

Versatility

- Real-time visibility into threat activity on your endpoints
- A turn-key solution that provides maximum protection on day one, even if a malware keylogger exists on your device currently
- Can be installed in an enterprise and deployed via group policy
- McAfee ePO (ePolicy Orchestrator) Compatible

Brand Enhancement

- Solidify trust earned from your clients
- Forms a good complement to your overall client offering
- This is NOT an Anti-Virus

The threat landscape is real and ever-expanding. The attacks on the DNC in July of 2018 were largely carried out through spear-phishing attacks using malware called "X-agent" to collect passwords through keylogging and screenshots. The Department of Justice breach in Dec was due to malware that included keyloggers used to steal usernames and passwords as the user of the victim systems typed them. The consequences for not reacting are costly. Endpoint lock™ will protect the initial transmission of usernames and passwords and subsequent keystrokes entered in to any program or application to avoid these incidences.

*Your **endpoint** is where your business is most vulnerable to attacks and cybercriminals always focus on your weakest links. That is why TBAS is suggesting prompt action in order to prevent spending great amounts of time, money, and effort to correct endpoint security pitfalls.*

The TBAS Mission

True business transformation requires properly evaluating people, processes, and technology and applying those learnings in innovative ways. Our mission is to leverage our industry expertise, research, technology, and proven methodologies to transformations that deliver profitability, growth, and optimal operational risk control, transparency and regulatory compliance.
