

Our areas of expertise include:

◆ **Unified Data Architecture**

We help organizations create unified data fabric with a single source of truth. Centralized data service for Ingestion, capture, validation, Enrichment, cleansing, normalization and storage managing data lineage. Unified data lakes facilitate use of data for analytics using AI and ML.

◆ **Legacy Product Reengineering**

We help vendors upgrade their legacy products, migrating them to new Data centric architecture, platforms and technology.

- Move from proprietary technologies to open standards
- Adopt SOA and microservices
- Embrace mobility and the cloud
- Use new capabilities (e.g. artificial intelligence, big data, distributed ledger, open APIs)

◆ **Technology and Architecture Expertise:**

- Artificial Intelligence
- Open API
- BIG Data & Analytics
- Cloud & Containerization
- Distributed Ledger
- Biometrics & Authentication

Historically, financial services applications were built on large complex monolithic architecture by automating process flows, and databases were used to store and capture data. Over time applications were modified and merged due to changing business and acquisitions. Monolithic architecture allowed very little common standard and reuse. This created fragmented systems and duplication of data and features as well as a myriad of point to point interfaces. Organizations today are in dire need of modernizing legacy infrastructure to improve state through processing efficiencies, reduce costs and improve customer experience. Change is everywhere!

Our **core competency** allows organizations to embrace this change in an effective manner without disruption, allowing our customers to focus on growing their business. Our team of senior professionals has combined experience of more than 500 years. Our work since 2007 has been facilitating large global financial services players in their goals to reduce costs, improve profitability, and align governance, risk, and compliance initiatives with the overall strategic vision of their organization. We have more than a decade of experience in designing and building complex, mission-critical, scalable, and secure enterprise-grade applications for some of the most important players in financial services.

We will begin with an **assessment** of your current/mature state operating model and technology infrastructure. We evaluate it against your future business goals. We then develop a roadmap for your future state operating model and technology transformation, and finally execute our transformation strategy to achieve your business goals. You will find that our proposal which includes a strong **execution** focus coupled with specialized financial services domain expertise is truly unique. We can walk with you from **assessment to execution**.
